

# T6 - Javascript Frameworks

T-JSF-600

## Bootstrap

Angular, here we are

First of all, [get started](#) with Angular.

Write a website that handles todo lists with the following features:

- create, modify ,archive and delete todo lists (with relevant info, such as a name, a creation date, a priority or whatever),
- check and uncheck tasks from the lists,

There must be **todoComponent** component.

Add unit tests for your main controller using [Karma](#).

The lists must be saved in local storage, to make data persist.

ngModel, ngFor

If you have some more time, add:

- sorting (to clarify views),
- filtering (to view specific tasks, or unchecked tasks for instance),
- tagging (linked to filters)
- ...
